

➤ 18. Phi6 Drivers for YAV Modules

Phi6 is the software environment to manage, control and program 6TL modules and systems.

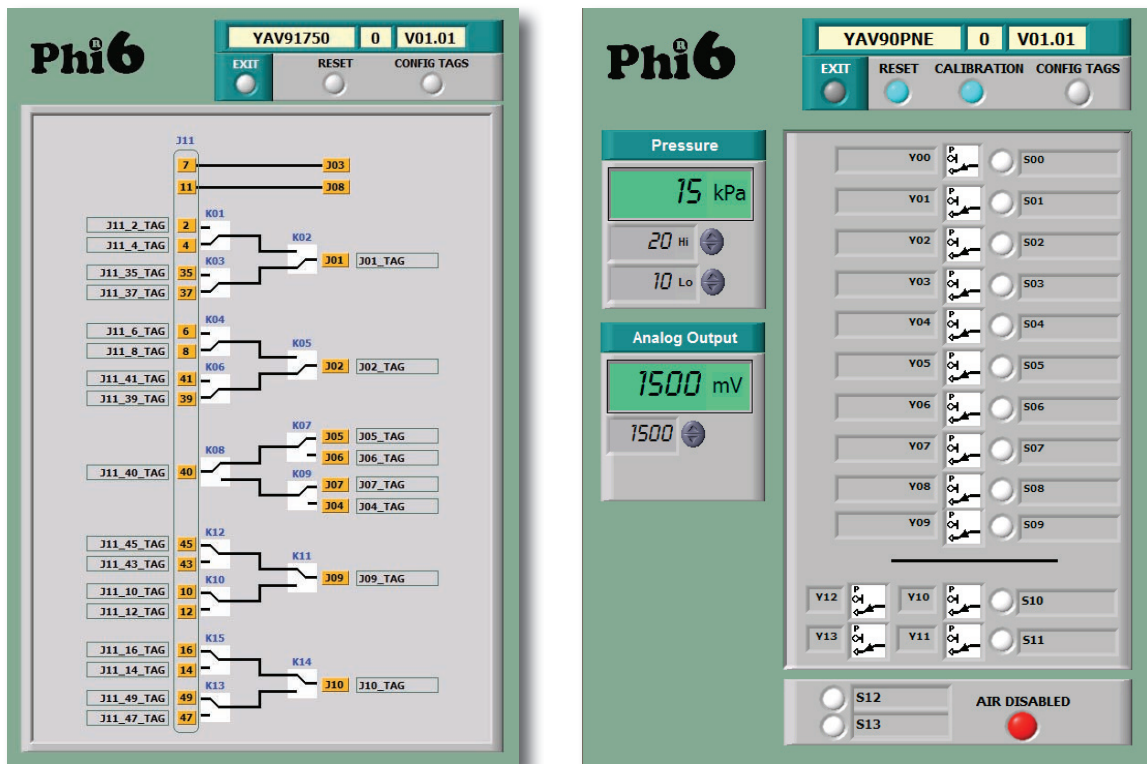

There are 2 main Phi6 components that are affecting the YAV modules from 6TL:

- Phi6 Explorer, to configure, calibrate, and quickly operate YAV modules
- Phi6 Labview and TestStand drivers: Labview and TestStand functions necessary to interface with the YAV modules.

The implementation of the YAV modules in your test system is very fast. When connected, the YAV modules are immediately operative. The Phi6 explorer program will detect all available resources in your system, and can be used to connect directly to each module, set variables, labels, test and calibrate each if applicable.

Download phi6 Drivers from http://www.6tengineering.com/knowledge_base.asp

Phi6[®]

- Plug your YAV module and the control screen will pop-up!
- Use Phi6 explorer to operate all 6TL YAV modules or 6TL devices manually.
- Phi6 Explorer is a powerful tool for test systems debugging.
